Fire_Hist_Polygons

The Fire History polygon feature class was created by the Idaho Panhandle National Forest to describe the spatial location and characteristics of wildfires on or near the Idaho Panhandle National Forest. Fire polygons can overlap. Source attributes for the wildfires were drawn from the fire record books of the Idaho Panhandle National Forest and the Kansas City FAST database. All wildfires attribute information is associated with the spatial graphic.

Fire_ Hist_Points

The Fire History point feature class was created by the Idaho Panhandle National Forest to describe the spatial location and characteristics of wildfires on or near the Idaho Panhandle National Forest. Source attributes for the wildfires were drawn from the fire record books of the Idaho Panhandle National Forest and the Kansas City FAST database. All wildfires attribute information is associated with the spatial graphic.

WUI (Wildland Urban Interface)

This map is a part of the IPNF Urban Interface project whose purpose is to define, identify, and map the wildland urban interface, determine the number of acres in the interface by ownership, and identify fuel treatment opportunities on FS land within the WUI. This mapping is necessary to set priorities for "at risk" urban interface areas, and fire preparedness.
